BELL SYSTEM PRACTICES Teletypewriter and Data Stations ADDENDUM P34.460 Issue 1, June, 1959 AT&TCo Standard

# INSTALLATION OF FUNCTION PARTS ON A 28 STUNTBOX

#### **1. GENERAL**

1.001 This addendum supplements Section P34.460, Issue 1.

1.002 This addendum is issued to (a) omit reference to the TP152339 modification kit previously furnished on an interim basis, and now replaced by the TP152307 modification kit; and (b) omit reference to the TP154745 modification kit, the parts of which have been included in the TP152307 modification kit.

#### 2. MODIFICATION KITS

The following change applies to Part 2 of the section: (a) 2.03—revised

INSTALLA-TION OF FUNCTION ADDENDUM P34.460 ON A 28 Page 1 STUNTBOX

#### 2.03 **Reperforator Control Modification Kit**

For (1) Control of an associated reperforator on receipt of UC-H or UC-F. When UC-H is received a contact is operated. When UC-F is subsequently received, the function associated with that character operates a latch-release bail which releases the function mechanism holding the contact operated.

If it is desired to operate the contact on receipt of UC-F with release on UC-H. the UC-F function bar should be installed in the slot with the TP152298 function lever, and the UC-H function bar should be installed in the slot with the TP152299 function lever. The modification kit can-

not be used in slots spanned by a latch-release bail.

Modification

Page 2

#### 2.03 Reperforator Control Modification Kit (Cont'd)

(2) The parts for the TP154745 Modification Kit previously listed here have been included in the TP152307 Modification Kit.

Note 1: If it is desired to space on the function that operates the latch-release bail, order a TP153670 function lever in addition to the modification kit. Use the TP153670 instead of the TP152299 function lever.

#### 1. GENERAL

1.01 This section contains the instructions for the installation of function parts on a 28 Stuntbox.

1.02 Although the instructions herein apply particularly to the AN stuntbox, they are not necessarily limited to that stuntbox. Reperforator control contacts, for instance, can be used on any stuntbox. Some of the sets of parts described herein are usable on the AG stuntbox (28A, A1, and A2 Typing Units) and AR stuntbox (28B, C and D Typing Units). The ADA stuntbox (28A Sequence Selector) and AED stuntbox (28H Typing Unit), are equipped for use with the 83B1 selective calling system. If local modification for other applications is desired, use may be made of the parts described herein.

#### 2. SETS OF PARTS

.

.

.

(1

2.01 Function Lever Sets of Parts

	For	S
)	The first slot (and inter- mediate slots if CDCs are of three or more letters) in the sequential operation of a function. Sequential operation takes place from the lower numbered slots to the next higher slot. The function lever in the lower numbered slot is latched operated on one character and unlatched on the next following character. The operation of this function lever un- gates the path of the func- tion bar in the next higher numbered slot, thus per- mitting it to operate if the next character received is the one for which it is coded. The only limit to the number of steps in a sequence is the availability of adjacent slots.	
	<b>•</b> • • • •	

Spacing is not suppressed with the operation of these parts. See Note 1.

	Consists of						
Sets of Parts	Quantity	Part No.	Part

			Consists of			
	For	Sets of Parts	Quantity	Part No.	Part	
(4)	Operation on one charac- ter and release by the operation of the latch-re- lease bail. (Notes 3 and 4.) The function may be oper- ated separately, or, in con- junction with TP153915 Sets of Parts, as the final operation of a sequence, to position a contact or a shift slide. Spacing is not suppressed	TP153918 (Note 2)		TP154698 TP90517 TP152298 TP152089 tion bar desi	function-lever spring function lever	
(5)	with the operation of these parts. See Note 1. Space suppression for cer- tain functions. (BL, LF, CR, etc.)	Parts must be ordered separately	1 1 1 1 1 1	TP4703 TP152653 TP154690 TP154698 TP90517 TP152641 TP152660	function-pawl spring wick function-lever spring function lever	

The function bar desired must be specified in addi-tion to the set of parts. See Part 5 and P34.101.

P34.460

INSTAL OF FU

### 2.01 Function Lever Sets of Parts (Cont'd)

- Note 1: For selective-calling applications, space suppression with the operation of these parts is not needed because:
  - (1) The typing unit is in the nonprint condition where spacing does not occur; or,
  - (2) The typing unit is in the print condition where spacing is suppressed for control functions such as BL, CR, FIGS, LF, LTRS, upper-case H, upper-case S (Bell).
- Note 2: Contact assemblies, contacts, and shift slides must be added if such parts are not already installed on the stuntbox. See Paragraphs 2.04 and 2.05.
- Note 3: A latch-release bail is operated in most cases by a pair of function levers a number of slots apart. The slots in between are equipped with functions which are to be latched and unlatched. One function lever is at an end of the bail and the other is at an intermediate point. (Since the bail is only fastened at the end, the function lever at the intermediate point may be installed in the most convenient slot.) Order two each of the parts in (2) except a TP154647 instead of a TP152642 function lever. In addition, the following parts are required:

shaft\* for latch-release bail
 TP119649 retaining rings

#### 2.01 Function Lever Sets of Parts (Cont'd)

\*Shafts for latch-release bails may obtained in the following lengths.

Length in Inches	Part No.
1.062	TP153838
1.484	<b>TP155071</b>
1.921	<b>TP154668</b>
<b>2.7</b> 96	TP154667
3.237	<b>TP154666</b>
<b>3.</b> 890	<b>TP155072</b>
4.984	TP155073
5.640	TP154669
6.077	TP153318

Note 4: If a latch-release bail is to consist merely of a short stud to release a function-lever latch in an adjacent slot (the unlatching function is limited to the one slot), order separately the parts as in (2), except a TP154647 instead of a TP152642 function lever. In addition, order the following parts:

1 TP152357 stud

- 1 TP110743 lockwasher
- 1 TP3599 nut

P34.460

#### 2.02 Description of Function Levers, Function-Lever Latches and Spring Plate

(a) The following tables describe the function levers and function-lever latches used in the various sets of parts.

			Projection	ns (Fig. 1)	_
Function Lever Used in Set of Parts		Blocking	Latching	Releasing	Space Suppression
TP152121	TP153915	х	х		
TP152298	TP153917, TP153918		х		
TP152299	Operate a latch- release bail		X	х	x
<b>*</b> TP152641	For Space Suppression				X
*TP152642	TP153916				
TP153670 (Not Shown on Fig. 1)				x	
TP154647	Operate a latch- release bail			х	X
TP157206 (Not shown on Fig. 1)			х		
TP157207 (Not shown on Fig. 1)		х	x		

#### TABLE 1

\* Momentary Operation

Note 1: The TP157206 function lever has a stud on its upper tip bent to the left (observed from the rear of the stuntbox) which can operate two contacts, one above the slot in which the function lever is installed and one above the adjacent lower numbered slot. In this way a transfer can be accomplished if a make and break contact are used.

The TP157207 function lever has part of its upper tip cut away so that it can be used in sequential operation with the TP157206 function lever. The TP152121 function lever **cannot** be used in sequential operation with the TP157206 function lever because the upper portion of its tip would interfere with the extension of the TP157206 function lever.

		P	rojections (Fig.	1)
Function-Lever Latch	Used in Set of Parts	Latching	Unlatching	Releasing
<b>TP152089</b>	TP153918	x		
TP154613	TP153915, TP153917	X	х	x

#### TABLE 2

(b) See Fig. 1 for the spring plate used in momentary operation of a function.

(c) In all cases, suitable function-lever parts must be provided in the slots over which contacts are installed.

INSTALLATION OF FUNCTION PARTS P34,460 01 A 22 Page 15 B0X

٠

#### **3. INSTALLATION OF PARTS**

#### 3.01 Function Parts—AN (28E, F, and G Typing Units), AR (28D, B, and C Typing Units), ADA (28A Sequence Selector), AED (28H Typing Unit) Stuntboxes

- (a) Before installing function parts, proceed as follows:
  - (1) Remove the typing unit from the base as per BSP Section P34.611.
  - (2) Remove the stuntbox from the typing unit as per BSP Section P34.611.
  - (3) Remove the rear handle from the stuntbox.
  - (4) Remove the retaining ring and slide the felt washers along the stripper-bail shaft from the stripper-bail cams.
  - (5) Remove the two screws that secure the stripper-bail cams to the stripper-bail shaft and slide the cams along the shaft and out of the notches in the left and right stripper-blade arms.
  - (6) Remove the screw that secures the left or right stripper-blade arm to its mounting bracket and disengage the arm from the stripper blade.
  - (7) Remove the stripper blade from its mounting brackets.
  - (8) Remove the stripper-bail shaft.
  - (9) Remove the retaining plate from the ends of the function shafts.
  - (10) Slide the function-lever retaining shaft from in front of the slot(s) in which the function parts are
  - to be installed.
  - (11) Install the function parts in accordance with Par. 3.03.
  - (12) Reassemble the stuntbox in the reverse order of 1-10.
- 3.02 Function Parts-AG (28A, A1, A2 Typing Units) Stuntbox
  - (a) Before installing function parts in the AG stuntbox, proceed as follows:
    - (1) Remove the typing unit from the base as per BSP Section P34.611.
    - (2) Remove the stuntbox as per BSP Section P34.611.
    - (3) Remove the retaining plate from the ends of the function shafts.
    - (4) Slide the function-lever retaining shaft from in front of the slot(s) in which function parts are to be installed.

- .
- (5) Install the function parts in accordance with Par. 3.03.
- (6) Reassemble the stuntbox in the reverse order of 1-4.
- 3.03 To install the parts for the function mechanisms, proceed as follows:
  - (1) Hook the function-lever spring in the hole in the function lever and insert the function lever in the proper guide-bar slot, back of the spring-plate shaft.
  - (2) Hook the function lever over the function-lever shaft.
  - (3) Slide the function-lever retaining shaft in front of the function levers and place it in the left or right mounting plate.
  - (4) Remount the retaining plate.
  - (5) Slide the function pawl over the tip of the function lever and position it on the function-pawl shaft.
  - (6) Lubricate the wick in the function-pawl spring and hook the spring in the hole in the spring guide-plate and over the end of the function pawl.
  - (7) Insert the function bar through the opening in the spring guide plate opposite the desired slot in the guide bar.
  - (8) Insert the function bar in the proper guide-bar slot and position it on the function-bar shaft.
  - (9) Hook the function-bar spring in the bottom hole of the spring guide-plate and over the projection on the function bar.

(10 Insert the spring plate or function-lever latch in the slot of the guide bar and under the spring-plate shaft. Position the spring plate or function-lever latch on the spring-plate shaft and snap the spring plate or function-lever latch upward under the spring-plate stop shaft. If the function-lever latch is of the type unlatched by the stripper bail, its unlatching projection should extend under the stripper blade. If the function-lever latch is of the type unlatched by the latch-release bail, its unlatching projection should be under the latch-release bail.

Note: When installing parts for sequential operation, first install the parts for the function to be operated on the final operation, then install the parts for the first or intermediate functions in the adjacent lowernumbered slots.

#### 3.04 Shift Slides and Contact Assemblies

(a) Mount the shift slide assemblies and contact assemblies over the slots in which functions are to be installed on top of the function-lever guide. using the mounting holes provided.

INSTALLATION OF FUNCTION PARTS P34.460 ON A 28 STUNT-Page 17 BOX

#### 4. STUNTBOX SLOT OCCUPANCY AND MODIFICATIONS

4.01 (a) The following tables list the occupancy of slots in the stuntboxes, as furnished. The slots are numbered one through 42, from left to right, as viewed from the rear of the typing unit.

.

#### 4.02 **Restrictions on Slot Use**

(a) General. Contact blocks and shift slides may be mounted on the function-lever guide, above the function-lever parts that will operate them, by means of mounting holes tapped in the function-lever guide. The presence of functions already installed, or certain functions for which specific slots are reserved (see the applicable table of slot occupancy) must be considered whenever additional shift slides or contact blocks are to be installed. In the examples where specific slot numbers are given, it is assumed that they are not required for any other functions.

(b) Contact Blocks. Possible locations for contact blocks are any two adjacent tapped holes back of the evennumbered slots from 8 to 42 for the AG, AN, AR, ADA, and AED stuntboxes. With the blocks mounted in a continuous row, all of the slots are potentially available for contact operation. However, with two-letter sequential codes, the operating function-lever mechanisms appear only in alternate slots. In some cases, as in the ADA and AED stuntboxes, a single function-lever may operate the contacts in two adjacent slots, one a make and one a break. This might be used as a substitute for a transfer contact, not available for single-slot operation.

(c) Shift Slides. Potential locations for shift slides (where the space is not occupied by other mechanisms) are slots 3 and 6 for the AG stuntbox, and slots 3, 8, 11, 14, 17, 20, 23, 26, 29, 32, and 35 for the AN, AR, ADA, and AED stuntboxes. Plans for the use of these slots require consideration of the adequacy of the latch release bail to release latched-up function levers and of the codebars to be shifted. For instance, the select (0) codebar can be shifted by a shift slide at slot 14 only.

(d) In general it is desirable to avoid mounting shift slides on adjacent sets of tapped holes because the resulting overlap of the adjusting ears makes adjustment somewhat inconvenient. However, to secure the maximum capacity of the stuntbox, it may sometimes be necessary.

(e) Since the shift slide was originally designed for threeslot sequential operation, special treatment is required for full use of all slots with two-letter CDCs. The example shows a way to use five pairs of slots for five two-letter CDCs without loss of a slot.

(1) Mount three shift slides at slots 17, 20, and 23.

(2) In the slide at slot 17 use a TP157164 slidebar, which

is operated by either one of two 2-character CDCs. Install the function-lever parts for one CDC in slots 15 and 16, and for the second in slots 17 and 18.

INSTALLATION OF FUNCTION PARTS ON A 28 STUNT-P34.460 BOX

Page 21

- (3) In the slide at slot 20 install a TP153795 slidebar and arrange it to operate on one 2-letter CDC, with the function-lever parts in slots 19 and 20.
- (4) In the slide at slot 23 install a TP157164 slidebar, with the function-lever parts in slots 21, 22, and 23, 24.

(f) Contact Blocks and Shift Slides. Contact blocks and shift slides cannot be mounted in immediately adjacent holes because of mechanical interference. For example, with the lockout shift slide at slot 14, it is not possible to mount a contact block at slots 16 and 18. However, a contact block can be mounted at slots 18 and 20, and another shift slide at slot 23 without interference between the two. These particular slot numbers refer to the AN stuntbox, where the arrangement might be a useful one. The tapped holes are not directly back of the slots but are associated with the nearest one for ease of reference.

#### 4.03 Modifications

(a) The modifications listed in the following tables are intended for selective-calling changes on the AN stuntbox. However, some modifications are given for the AG and AR stuntboxes since it may be useful to equip either of these for the function desired without the selective-calling features of the AN stuntbox.

# TABLE 1

# Function Lever Parts and Shift Slides

•

#### 5. UNIVERSAL FUNCTION BAR

5.01 A universal function bar, TP153440, is available with tines at all the code levels (Print, 4, 1, 5, 2, 3, Select, and FIGS-LTRS Shift) which may be broken off as desired, thus permitting the function bar to be coded for any character with or without the restrictions necessary for use in selective calling. When the codebars are moved so that those opposite marking tines on a function bar are in the left-hand or marking position, and those opposite spacing tines are in the right-hand or spacing position, the function bar can move into selection. As a basis for determining which tines should be removed, the following table shows the relation between the positions of the print, select, and FIGS-LTRS shift codebars and the typing unit condition as affecting which function bars will go into selection.

	Typing Unit Condition			
<b>Codebar</b> Position	Left (Marking)	Right (Spacing)		
Codebar Name				
Print	Nonprint	Print		
Select	Select	Nonselect		
FIGS-LTRS Shift	FIGS (upper case)	LTRS (lower case)		

To code the TP153440 function bar, proceed as follows:

- (a) Hold the function bar so that the tines appear as in Fig. 2(b).
- (b) Consider that the tines have the arbitrary numbers assigned as shown in Fig. 2(b).
  - Note that these numbers have no direct relation to the code element numbers associated with the codebar stack and the function bar tines; the correlation is as follows:

Code Element No.	Corresponding Tine Nos. of Fig. 2
4	<b>3</b> and <b>4</b>
1	5 and 6
5	7 and 8
2	9 and 10
3	<b>11</b> and <b>12</b>

•

.

(1) Character	Tines To Be Marked For Removal
А	3-6-7-10-11
В	4-6-8-9-11
С	4-5-7-10-12
D	<b>4</b> -6 <b>-7-</b> 9-11
E	<b>3-</b> 6- <b>7-</b> 9-11
F	4-6-7-9-12
G	4-5-8-10-11
H	<b>3-</b> 5-8-9-12
I	<b>3</b> -5- <b>7</b> -10-12
J	<b>4</b> -6- <b>7</b> -10-11
K	4-6-7-10-12
L	3-5-8-10-11
Μ	4-5-8-9-12
N	4-5-7-9-12
0	4-5-8-9-11
Р	3-5-8-10-12

R	4-5-7-10-11
S	3-6-7-9-12
T	3-5-8-9-11
U	3-6-7-10-12
V	4-5-8-10-12
W X	3-6-8-10-11
X Y	4-6-8-9-12
Z	3-6-8-9-12
Z BLANK	3-6-8-9-11
CR	3-5-7-9-11
LF	<b>4-</b> 5- <b>7-</b> 9-11
SP	3-5-7-10-11 3-5-7-9-12
LTRS	<b>4</b> -6-8-10-12
FIGS	
FIGS	4-6-8-10-11

(c) Mark the tines that are to be **removed** in accordance with the following table.

(2) In addition to those tines marked for the character, the Print, Select, and FIGS-LTRS Shift tines should be marked for removal according to the following:

Ψ.	

		Tines To Be Marked For Removal		
To Respond In	Shift	Print	Select	
FIGS Condition	16			
LTRS "	15			
Both FIGS and LTRS Conditions	15 and 16			
Print*		1		
Nonprint		2		
Both Print and Nonprint Conditions		1 and 2		
Select*			14	
Nonselect			13	
Both Select and Nonselect Conditions			13 and 14	
*With selective calling, the Print and Select levels both must be considered. Without selective calling, tines 1, 2, 13, and 14 may be marked for removal.				
(d) <b>Recheck</b> the tines marked and remove the tines.				

5.02 The following examples describe the coding of the TP153440 universal function bar for use in selective calling.

Call Directing Code-Select Condition

Remove tines 1, 2, 14, 15, 16 (unless otherwise indicated) Remove the tines for the desired character

**Upper-Case Control Character**—(Print, Upper Case, For example: Upper-Case S (Bell) in slot 25)

Remove tines 1, 13, 14, 16 Remove the tines for the S character

#### 5.03 Coding the Universal Function Bar for Multiple Response to Two or More Characters

(a) For some special applications it may be desirable to arrange a function bar so that it will respond to either one of two characters or to any one of more than two characters. The method described below offers a systematic way of doing this for particular combinations of letters by taking advantage of certain characteristics of the 5-unit teletypewriter code. As shown, it is possible to code a bar to respond to any one of two, four, eight, sixteen, or 32 characters.

(b) For response to either one of two, the 5-unit codes of the two characters chosen must differ by only one signal element. As an illustration, consider the letter A

INSTALI OF FU	
	PARTS N A 28 STUNT- BOX

(marking elements 1 and 2) and the letter W (marking elements 1, 2, and 5). These differ only in the fifth element. If now both marking and spacing tines are removed at position 5, with marking tines at positions 1 and 2, and spacing tines at positions 3 and 4, the resulting function bar will respond to either A or W when received by the machine.

(c) For response to any one of four letters, choose four,

such as A, J, K, and U, which have three code elements in common, 1 and 2 marking, and 5 spacing. In this case, remove both marking and spacing tines in code positions 3 and 4. The bar will then respond to any one of the four letters.

(d) For response to any one of 8 letters, choose letters with two code elements in common and remove the tines

in three positions. By analogy the plan might be extended to 16 and 32 letters. (Note that the term "universal" has sometimes been used for a function bar responding to all of the 32 characters of the code.)

(e) The code element numbers referred to in this discussion have no relation to the tine numbers assigned for convenience as indicated in Fig. 2. However, a simple use may be made of the table in 5.01 (c) to accomplish the same result. Note that the tines to be removed for the letter A (3, 6, 7, 10, 11) and for the letter W (3, 6, 8, 10, 11) differ in only one position, 7 and 8. Remove **both** marking and spacing tines in this position and the function bar will respond to either of the two letters. The principle can be extended to the other cases.

#### 6. SELECTION PREVENTION CLIPS

- 6.01 (a) A TP152127 selection prevention clip is available to provide optional changes, such as disabling a function in the unoperated or operated position. The clip can be positioned in three ways:
  - (1) To have no effect.
  - (2) To hold the function lever operated at all times.
  - (3) To prevent the function pawl from being moved by the function bar, thus keeping the function lever unoperated at all times.

(b) The clips provide for optional control in two slot sequential operation, for example: The AR stuntbox is equipped for upper-case BLANK response in slot 28 and upper-case H response in slot 29 provided that the next character received after upper-case

that the next character received after upper-case BLANK is upper-case H. The upper-case H function

lever operates the motor stop contact. A clip, furnished for slot 28, can be positioned to have the following effects:

- (1) Right-hand Position—Clip positioned to have no effect. The motor stops on FIGS BLANK H.
- (2) Center Position—Clip positioned to raise the function pawl in the BLANK slot, thus keeping its function lever unoperated. This in turn prevents

the operation of the upper-case H function which disables the motor stop feature.

(3) Left-hand Position—Clip positioned to hold the function lever in the BLANK slot operated at all times, thus enabling the adjacent upper-case H to operate whenever its character is received.

(c) The clips **can** be used only for slots other than 2, 9, 16, 22, 28, 35 and 42 since they can be mounted only for those slots.

(d) When a clip is used at one of these slots, the next lower numbered slot is unusable since the clip partially covers it.

6.02 A TP157274 selection prevention clip is available which, when placed under the function pawl and over the cable

channel, disables the function by raising the function pawl thus preventing it from being engaged by its function bar. The clip may be used to disable functions in slots where it is not convenient to use a TP152127 selection prevention clip.

6.03 A TP154650 clip is available to hold the print codebar in its print (spacing) position. The clip mounts on the codebar-detent bracket. It is standard equipment on the 28D, B, and C typing units. (AR stuntbox) The clip is provided so that function bars with a print restriction (such as the TP153437 print, upper-case S function bar in slot 30 and the TP153435 print LF function bar in slot 40 of the AR stuntbox) can be used. This is to facilitate the possible conversion of those units to selective calling. The clip can also be used on 28E, F, and G typing units if it is desired to convert those units to nonselective calling.

#### 7. REFERENCE TO BELL SYSTEM PRACTICES

7.01 BSP Section P34.610 contains an index of BSPs that have information applicable to the 28 stuntbox.
